

Mackenzie Browne

Full Stack / Mobile Engineering Leader

Amsterdam

Staff-level engineer with 13+ years building production mobile and web systems across startups, scale-ups, and large enterprises. Increasingly focused on AI-native engineering workflows: designing the feedback loops, tooling, and guardrails that let AI coding agents build, verify, and test changes on real devices. Specializes in React Native architecture, consumer-facing mobile apps, and the full journey from zero to shipped — including the CI/CD infrastructure, testing, and developer tooling that make teams fast and reliable. Currently leading mobile at Hunkemöller; previously at Shopify on the POS platform across mobile, web, and DevOps. Based in Amsterdam, open to senior IC, staff, and engineering leadership roles.

Experience

Hunkemöller

Hilversum

Mobile Lead (Contract) - Hunkemöller App

May 2026 – Current

- Built and owned a greenfield mobile app in a shared TypeScript monorepo (React Native, Expo, expo-router), from repo setup through checkout, auth, offline handling, and deep linking, as one of the top contributors to the codebase.
- Designed an agent-driven UI verification pipeline: an AI coding agent drives a live simulator over MCP, replays Maestro flows, and gates on pixel diffs against per-platform baselines. Tuned the anti-aliasing tolerance to eliminate false positives, so CI reliably catches even subtle visual regressions.
- Prototyped a Figma-to-device design token pipeline connecting the design system directly to the app — designers publish a theme in Figma and a single sync command brings it on-device, removing the manual design-to-code handoff.
- Contributed back to the React Native open-source ecosystem with a merged upstream fix to react-native-screens (the native tab layer behind Expo Router), unblocking E2E test automation for every app using the library.
- Shipped on-demand headless E2E for iOS and Android on GitHub Actions — comment-triggered and kept off the required-check path so compute spend stays deliberate.

Shopify

Amsterdam

Senior Engineer - Retail

Jun 2022 – Apr 2026

- Fixed a critical KMM/JS type coercion bug in the receipt printer in the first week — then continued contributing to the broader KMM/React Native architecture, debugging state sync issues across the Kotlin business logic and JS UI layers.
- Rewrote the POS numeric keypad to use integer currency units, eliminating an entire class of currency symbol and backspace bugs and simplifying future maintenance.
- Led a tiger team with the Principal Engineer to overhaul the React Native e2e test suite — resolved foundational architectural issues, redistributed ownership across teams, and drove the suite to 100% pass rate.
- Led the migration from Yarn to pnpm across the POS monorepo — a 40,000-line changeset — using AI-assisted development tooling as part of the team's standard engineering workflow.
- Optimized FlatList rendering and offline sync performance across the POS; led several projects including receiptless returns and a full overhaul of the POS UI.

SQLJava

Senior Engineer - Global Solutions

Oct 2021 – May 2022

- Delivered high-priority feature requests for enterprise customers (including Fortune 500 clients), working with full autonomy from requirements through to production.
- Rapidly onboarded to a new stack (Go and Dart), contributing meaningful refactors and feature additions within weeks.
- Extended core application workflows including custom wizards, feature flags, and parameterized component refactors on the Go backend.
- Conducted technical interviews as part of growing the European engineering team.

Nationale Nederlanden

Amsterdam

Senior Engineer & Tech Lead - Architecture and Innovation

Jul 2020 – Sep 2021

- Tech Lead on the NN Bank mobile app team (React Native), delivering features including a swipeable card UI displaying live customer IBAN and account details.
- Implemented a custom bitwise encryption module in JavaScript for secure PIN and credential transmission, built to specification from a payment provider with full unit test coverage including known-answer tests against provider-supplied key/value pairs.
- Established screenshot and end-to-end testing infrastructure using Detox across the mobile app.
- Led the company-wide UI component library initiative — consolidated duplicate components across product teams into a single shared source, standardised APIs, and built a sandbox app with documented examples to drive adoption.
- Leveraged the bank's push notification framework extensively throughout feature development — nearly every flow had configurable alerts, including interactive notifications requiring user response, which shaped how features were designed and tested.
- Implemented deep linking to handle external triggers (email activation, third-party redirects) routing users directly into authenticated in-app actions.
- Integrated Crashlytics for OS-level crash reporting alongside React Native error boundaries, providing production observability beyond what the JS layer surfaces.
- Conducted 50–100 technical interviews during a major hiring expansion, developing evaluation criteria and technical assessments to screen candidates — largely international hires — with a focus on surfacing genuine ability over rehearsed answers.
- Progressing toward Engineering Manager before departing; the Architecture & Innovation team was subsequently disbanded.

Elsevier

Amsterdam

Senior Engineer - Scopus

Feb 2020 – Jul 2020

- Built a Git-abstraction CLI tool for non-Git-native developers — wrapping branch management, merges, and commits in npm scripts with guided conflict resolution, enabling the wider team to consume and update shared HTML web components without Git knowledge.
- Contributed to the micro-frontend architecture rebuild of the Scopus homepage.
- Conducted technical interviews to support team growth.

Prodigy Education

Toronto

Senior Engineer - Principal Web Squad

Jun 2018 – Sep 2019

- Built the Principal dashboard from the ground up — aggregating student and teacher data across entire schools into views unique to the principal role.
- Collaborated closely with product and design in extended sessions to define UX and feature scope for a net-new user type.

Lead Mobile Engineer

- Built a custom in-app developer console for mobile QA — exposing Chrome-style commands (game state warping, debug shortcuts) directly from the mobile app, eliminating the need to

manually play through the game to reach test states.

- Implemented Google OAuth for the mobile app, which had been disabled on mobile entirely — including account recovery for users who had previously authenticated via Google with no mobile login path.
 - Drove mobile performance improvements across the app — reduced startup time, trimmed app footprint, and optimised in-game content and loading screen performance for a smoother experience on lower-end devices. Integrated Crashlytics for native crash reporting alongside in-app logging.
 - Designed and implemented the full CI/CD pipeline: branch-protected promotion flow (development → staging → main), automated TestFlight and Google Play deployments on merge, app signing, staging-gate quality checks, and a two-approval PR requirement — enabling junior developers to ship confidently to production.
 - Introduced Docusaurus to the engineering org — presented the proposal, migrated all existing content in advance, and launched a fully working site the same day leadership approved it.
-

Self Incorporated Consultant

Canada & USA (On-Site and Remote)

Full Stack, Mobile Developer & Architect

August 2011 – June 2018

- Built a full passenger/driver ride-sharing mobile app with real-time geolocation for Transit Labs / RideCo.
- Developed an award-winning CMS for the Wynonna Earp TV series — geo-locked and time-locked to release content by region and episode air time, built in MeteorJS with advanced mobile-compatible parallax effects.
- Served as Technical Director at Shop Bonsai — hired and led a team of 8, built a custom hybrid e-commerce app with merchant product management and order processing, deep linking with web fallbacks to ensure an uninterrupted experience with or without the app, and two-way push notification flows with control-flow logic including local and remote-triggered notifications with user response handling.
- Built unofficial IBM mobile clients including ClearConcert, a Rational Team Concert mobile client.
- Delivered full-stack and hybrid mobile projects across IBM, NYPD, NBC, Syfy/Space Channel, and multiple Toronto startups and nonprofits.

Education

University Of Ontario Institute of Technology

Oshawa, Canada

Bachelor Of Science with Honours

2007 - 2012

- Computer Science with minor in Mathematics. Thesis involving concurrent, multi-core web crawling.
- 16 Month Internship in Web Application Development at IBM.
